## What is AmDisc™ Amniotic Membrane Therapy?

**AmDisc™ is a natural biological tissue with powerful healing properties. It has been used for decades to promote regeneration and reduce inflammation in damaged or diseased tissues. Now, it's available as a non-surgical, in-office treatment for a variety of eye conditions.**

**AmDisc™**

## How the Procedure Works

1. Application of the Allograft – Your eye doctor will place a thin, protective amniotic membrane onto your eye.
2. Secured with a Contact Lens – A soft, clear contact lens is placed over the membrane to keep it in position and enhance comfort.
3. Healing Begins – Over the next several days, the membrane naturally dissolves, delivering growth factors and anti-inflammatory properties to your eye.
4. Follow-Up Care – Your doctor will monitor your progress and provide post-procedure care as needed.

## Conditions That May Benefit from This Treatment

- Dry Eye Disease
- Corneal Erosions
- Post-Surgical Healing
- Chemical or Thermal Burns
- Persistent Epithelial Defects
- Ocular Surface Disease

## Is the Procedure Safe & Comfortable?

Yes. AmDisc™ is a well-established, safe treatment option that follows strict FDA regulations. Patients typically experience minimal discomfort, and the contact lens helps maintain a normal, functional lifestyle during healing.

## What to Expect After the Procedure

- Your vision may be slightly blurry at first.
- Over time, your eye absorbs the healing components of the graft.
- The membrane naturally dissolves, and your vision will improve as your eye heals.
- Follow your doctor's post-care instructions for the best results.
